# Pfizer Covid-19 Vaccine increases Children's risk of Death by 5100% according to the Office for National Statistics

BY THE EXPOSÉ ON FEBRUARY 7, 2022 • ( 24 COMMENTS )

Listen Now

There is a massive difference in death rates among children vaccinated against Covid-19 and their unvaccinated counterparts in England and Wales according to official data published by the Office for National Statistics which shows fully vaccinated children's risk of death due to any cause increases by 5,100%.

presented only the data for individuals ages 18 and over.

Month	Age-group	Vaccination status	Number of deaths	Person-years	Age-standardised mortality rate per 100,000 person-years
May	18-39	Unvaccinated	153	651,561	25.6
May	18-39	Within 21 days of first dose	4	53,775	8.1 u
May	18-39	21 days or more after first dose	79	114,200	65.6
May	18-39	Within 21 days of second dose	26	50,840	47.0
May	18-39	21 days or more after second dose	44	79,515	55.2
May	40-49	Unvaccinated	213	109,872	221.0
May	40-49	Within 21 days of first dose	29	82,454	37.9
May	40-49	21 days or more after first dose	247	169,064	145.0
May	40-49	Within 21 days of second dose	55	46,398	114.4
May	40-49	21 days or more after second dose	100	60,846	164.0
May	50-59	Unvaccinated	350	49,609	717.2
May	50-59	Within 21 days of first dose	12	3,925	273.1 u
May	50-59	21 days or more after first dose	817	294,958	275.7
May	50-59	Within 21 days of second dose	205	104,827	190.7
May	50-59	21 days or more after second dose	378	92,554	399.9

The vaccinations, on the other hand, are available to children as young as 12, who were allowed to receive the injection against their parents' wishes. In some cases, children as young as five have been given a reduced dosage of the vaccines.

However, on table 9 of the '[Deaths by Vaccination Status](#)'

(<https://www.ons.gov.uk/peoplepopulationandcommunity/birthsdeathsandmarriages/deaths/datasets/deathsbyvaccinationstatusengland>) dataset, the ONS have inadvertently provided enough details on deaths among children and teenagers by vaccination status for us to calculate the mortality rates ourselves.

The data showed a massive increase in deaths among single-vaccinated and double-vaccinated children compared to their unvaccinated counterparts. For children aged 15 to 19, the risk of death increases by 82% following the first shot, and a shocking 226% following the second shot.

But things are much worse for 10 to 14-year-olds. The risk of dying increases by a mind-blowing 885% following the first shot, and then an earth shattering 5105% following the second dose.

This means that children between 10 and 14, who had at least one shot of the Covid-19 vaccine, were 10 times more likely to die between January and October 2021, while children who had the second dose were 52 times more likely to die.

We also see this reflected in the [figures for deaths among the age group](https://dailyexpose.uk/2021/11/24/child-deaths-increasing-since-offered-covid-vaccine/) which were also published by the ONS.

Deaths among children aged 10 to 14 had risen by 44 percent between 20th Sep (*the first week following the roll-out of the vaccine to all in this age group*) and 14th Nov 2021 compared to the five-year average between 2015 and 2019.

## Risks clearly outweigh benefits of COVID vaccine among children

The Joint Committee on Vaccination and Immunisation (JCVI), an independent adviser to the U.K. government on the immunisation program, determined last year that the available evidence indicates that the individual health benefits from COVID-19 vaccination are small in children aged 12 to 15 years.

They also noted that any benefit granted by the shots is only “marginally greater” than other potential known harms. They also acknowledged that there is “considerable uncertainty regarding the magnitude of the potential harms.”

Due to the uncertainty of the risks involved with the Covid-19 injections, the JCVI considered the benefits too small to support advice on a universal program for vaccination of otherwise healthy 12- to 15-year-old children.

Dr Mike Yeadon warned in early 2021 that children are [50 times more](https://dailyexpose.uk/2021/07/09/dr-mike-yeadon-children-are-50-times-more-likely-to-die-from-the-covid-vaccines-than-from-the-virus-itself/) [likely to get killed by the vaccine](https://dailyexpose.uk/2021/07/09/dr-mike-yeadon-children-are-50-times-more-likely-to-die-from-the-covid-vaccines-than-from-the-virus-itself/) than by the virus itself.

The former vice president and chief scientist for allergy and respiratory at Pfizer, stressed that the vaccines used against Covid-19 have not been sufficiently tested and that they shouldn't have received emergency use authorisation when there are safe and effective medicines available for COVID-19.

Yeadon also said that young people are not susceptible to Covid-19, and "it's a crazy thing to vaccinate them with something that is actually 50 times more likely to kill them than the virus itself."

With official ONS data now showing children are 52 times more likely to die than unvaccinated children, it looks like Dr Mike Yeadon underestimated the true damage these experimental Covid-19 injections were about to cause.
