## Virologists Blow-the-Whistle: MPOX is actually Known Side-Effect of COVID Vax!

HAL TURNER | WORLD | AUGUST 23, 2024 | HITS: 57015

Top doctors worldwide are stepping forward to expose the World Health Organization’s monkey-pox scare as a cover-up for known side effects linked to the COVID mRNA vaccines.

According to leading virologist Dr. Poornima Wagh, we are not experiencing an outbreak of monkey-pox around the world, as claimed by the WHO. As Dr. Wagh explains, **the symptoms experienced by those diagnosed with monkey-pox are actually a known side-effect of the Covid shots: Auto-Immune Blistering Disease.**

Meanwhile, Dr. Wolfgang Wodarg has warned that the **WHO’s claims of a monkey-pox emergency is another scam and the disease we are witnessing is actually the**

## result of destroyed immune system shingles caused by the Covid shots.

Monkey-pox cases are currently being reported in highly vaccinated countries around the world, while lesser-vaccinated countries are not reporting any cases.

Autoimmune blistering diseases are a group of rare skin conditions that occur when the body's immune system attacks skin proteins, causing blisters and inflammation. The two most common types are pemphigus and bullous pemphigoid:

- Pemphigus  
This condition causes blisters to form on the skin and mucous membranes, such as the mouth, nose, throat, genitals, and eyes. The blisters can be soft and break easily, forming painful sores. If left untreated, pemphigus can be fatal.
- Bullous pemphigoid  
This condition causes hive-like lesions and large, itchy blisters that are filled with fluid. The blisters can break open and form ulcers. Bullous pemphigoid often occurs in older people and usually goes away within five years.

Other types of autoimmune blistering diseases include pemphigoid gestationis, mucous membrane pemphigoid, and IgA autoimmune bullous dermatoses.

Complications of autoimmune blistering diseases include:

- Infections from blisters that pop open
- Scars after blisters heal
- Difficulty eating, swallowing, or breathing in the throat or lungs
- Gum disease and tooth loss in the mouth
- Vision problems in the eyes

EN

• Treatments for autoimmune blistering diseases include:

- Anti-inflammatory medicines like corticosteroids
- Antibiotics like tetracycline
- Niacin, a B complex vitamin
- Anti-inflammatory creams applied to the skin
